Crack, PCP, Ecstasy, and Other Illicit Drugs

MALKISCH

A "Tyrant"

Crack is a type of cocaine that is usually smoked or intravenously injected. It is popular for its rapid onset of euphoria and high, which is why it is often referred to as a "titanic high." Crack is highly addictive and can lead to severe physical and psychological problems.

PCP (Phencyclidine) is a synthetic drug that is commonly found in the form of a powder or liquid. Its effects are highly unpredictable and can range from mild to hallucinations, delirium, and seizures. PCP is known for its ability to cause a delusional state where users may experience heightened sensations and aggression.

Ecstasy or "MDMA," is a stimulant that is commonly taken during parties or raves. It is known for its ability to induce feelings of joy, euphoria, and empathy, often leading to a sense of connection with others. However, Ecstasy use has been linked to long-term cognitive and physical health issues.

Other illegal drugs include hallucinogens like LSD or DMT, which are known for their ability to alter perception and cognition. Hallucinogens can cause intense visual and auditory hallucinations, as well as feelings of altered time perception and a sense of awe.

These drugs pose significant risks to health and behavior, and their use can have severe consequences on individuals and society. It is crucial to understand the effects of these drugs and take necessary steps to prevent their use and promote awareness of their dangers.
